## Antacid Experiment

In this experiment, the reagents combined are an acid, HCl (aq) and a base, NaOH (aq) where the acid is the analyte and the base is the titrant. The reaction between the two is as follows:

## ANALYSIS OF STOMACH ANTACID TABLETS

Antacids are used to resist heartburn. We sometimes use them to treat this because antacids are a mild base that can neutralize acids in our stomachs, such as HCl. The purpose of this lab is

## Chemistry 104: Analysis of Antacid Tablet

The aim of this laboratory experiment is to quantify the amount of HCl neutralized by two different antacids. The active pharmaceutical ingredients (APIs) in antacids work by either raising the pH and/or by buffering the

This method of analysis is called a back-titration. The reactions above are reversible, which means that  $\text{CO}_2$  dissolved in water will produce some carbonic acid. This acid will react with the  $\text{NaOH}$  we are titrating and give us inaccurate results.

## Titration of a Commercial Antacid

To do the experiment, an antacid tablet will be dissolved in a known excess amount of acid. The resulting solution will be acidic because the tablet did not provide enough moles of base to completely neutralize the acid. The solution will be titrated with base
