drawing and ...

Typically, an orthographic projection drawing consists of three different views: a front view, a top view and a side view. Other names for these views are plan, elevation and section. Occasionally, more views are used for clarity. The side view is usually the right side, but if the left side is used, it is noted in the drawing. Orthographic projection can be subdivided into three categories: isometric, diametric and trimetric projection. An orthographic drawing is a clear, detailed way to ...

What Is An Orthographic Drawing (With Examples) - Don Corgi

(In making an orthographic projection, any point in the object is mapped onto the drawing by dropping a perpendicular from that point to the plane of the drawing.) An isometric projection results if the plane is oriented so that it makes equal angles (hence "isometric," or "equal measure") with the three principal planes of the object.

oblique. Another way to look at it is that in an orthographic projection, the projector lines intersect the plane being projected on to at a perpendicular angle (thus, they are orthogonal , thus the name of the projection), whereas in an oblique projection those lines form oblique angles (non-right angles) with the projection plane.

What is the difference between isometric and perspective ...

Orthographic drawings show a three-dimensional object in two dimensions. It is a form of parallel projection, where the view direction is orthogonal to the projection plane resulting in every plane of the scene appearing in affine transformation on the viewing surface. So the difference between these drawings is that isometric drawing is when all three dimensions of an object are
